The International Tomographic Center, SB RAS: in Real Life, There is Nothing More Practical than a Good Theory

Many books and articles have been written about how a science and practice interact. There is also no need to prove that a science influences practice and vice versa – that practice is a driver of any science. The events of their efficient interaction are very likely to be as numerous as the forms and models of such interactions. Whatever a branch of knowledge and sphere of its application are, its basis is a human being who is dissatisfied with today's situation and capable to improve it in the future. Being not only a point of growth of fundamental studies in chemistry and medicine on the basis of a magnetic resonance method but also a good center of medical diagnostics, the International Tomographic Center is a clear argument for this thesis and against an idea of separating knowledge generation from knowledge application. A boundary line is mobile and unapparent but its basis is creativity but not management.
